I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

ELECTROLYSIS PROCESS AND APPARATUS

Field of the Invention

The invention relates to electrolysis of a fluid. In particular the invention relates to an electrolysis process and an apparatus for carrying out the process.

Background of the Invention

Due to concerns about the environment, pollution and depletion of limited fossil energy sources attention is given worldwide to renewable clean energy sources.

Due to the intermittent nature of these sources (solar, wind, etc.) some means of energy storage is required.

Hydrogen gas produced by electrolysis during the availability of the primary energy has been identified as a viable way to store energy. It can also serve as an energy carrier where hydrogen is produced at the site of the source (nuclear, fossil or renewables) and converted to hydrogen through electrolysis which is then transported to where the energy is required. Hydrogen is further a candidate for fuel for vehicles utilizing high efficient fuel cells.

The basic science involved in electrolysis is well known. Commercial plants have been in operation for decades, but due to the projected large future demand for hydrogen the following problems were identified with present technologies as set out in a United Nations report - Renewable Energy – United Nations Project, Johansen *et al*, p 929:

- *"Changing the cell configuration and geometry with the goal of reducing the cell resistance by a factor of 3 to 10 thereby reducing the ohmic voltage losses*

- *Developing new and inexpensive electrocatalyst materials able to reduce the sum of anodic and cathodic overvoltage to about 0.3 volt or less*

- *Developing new diaphragm materials that are superior to conventional asbestos cloth."*

The applicant has identified a need for an improved electrolysis cell, and a method of producing gasses by electrolysis, with high current density and efficiency, cheap and simple construction and with high gas purities without the need for subsequent purification.

Summary of the Invention

According to a first aspect of the invention, there is provided an electrolysis apparatus for the production of hydrogen and oxygen, which apparatus includes at least: -

two or more tubular electrodes, at least one of which is an inner electrode located in at least one outer electrode; and

a separator interposed between the inner and outer electrodes and substantially coextensive therewith.

One or more of the electrodes may, in use, be an anode.

One or more of the electrodes may, in use, be a cathode.

The separator may be positioned between the anode and the cathode so that there is substantially no gap between the separator and the anode, and the separator and the cathode.

A portion of the separator may be bonded to a support structure associated with the anode and/or the cathode using, for example, an epoxy sealant.

The electrodes may be made of an apertured conductive material.

The electrodes may be plated.

The apertured conductive material may be a sintered body having flow channels extending between the inside and the outside thereof.

The apertured conductive material may be a single layer mesh.

The apertured conductive material may be made of two or more layers of mesh.

The apertured conductive material may be a three dimensional mesh.

The apertured conductive material may comprise a conductive polymer. The polymer may be coated with a conductive material, for example, a metal.

The apertured conductive material may comprise of silver, nickel, stainless steel or copper.

The anode and cathode may be substantially concentric.

A plurality of anodes and cathodes of various diameters may be nested to provide a high electrolysis surface area to electrolysis apparatus volume ratio.

The cathode and/or anode may be made of one or more first material i.e. the substrate, and plated with a second material or composition of matter which is electrically conductive.

The anode may be made of a conductive metal, for example, stainless steel mesh.

The anode may comprise two or more layers of stainless steel mesh.

The anode may be nickel plated.

The cathode may be made of a conductive metal, for example, stainless steel mesh.

The cathode may comprise two or more layers of stainless steel mesh.

The cathode may be nickel plated.

The mesh may be nickel plated before or after the layers of stainless steel are placed together.

One or more of the tubular anode and the cathode may be closed off at one end such that, in use, an overpressure is established within the closed off tubular anode or cathode.

One or more conductors may be provided in association with the anode and/or the cathode.

In one embodiment a tubular mesh conductor is provided on the outside of the anode and another on the inside of the cathode.

In another embodiment, the conductors are in the form of one or more conductive strips attached to a portion or portions of the anode and/or the cathode.

The separator may comprise one or more layers of a fibrous material.

The separator may comprise one or more layers of a wettable material.

The separator may comprise one or more layers of a wettable fibrous material.

The separator may comprise one or more layers of cellulose containing composition.

The cellulose containing composition may be paper.

The paper may be a filter paper.

The filter paper may be chemical resistant filter paper.

The filter paper may be medium to fast grade filter paper.

In an embodiment, the apparatus may consist of :

- a tubular apertured stainless steel mesh anode electrode; and
- a tubular apertured nickel-plated stainless steel cathode electrode, wherein the cathode and anode are substantially concentric and the cathode lies within the anode; and
- a separator means between the anode and cathode comprising one or more layers of a fibrous material.

The apparatus may, in use, include an alkaline electrolyte solution.

The apparatus may, in use, include an acidic electrolyte solution.

The apparatus may include means for supplying and conducting electrical current to the electrodes.

The apparatus may include means for drawing off the gasses.

The apparatus may include means for removing vapour from the generated gasses.

A plurality of anode and cathode sets may be used in parallel.

A plurality of anode and cathode sets may be used in series.

The anode and cathode sets and the conductors may be configured in such a way that a plurality of such sets is arranged around a tubular conductor for the anodes, all in a common electrolyte. Each cathode may be connected to its own conductor.

The invention extends to a separator for an electrolysis apparatus, which separator is interposed between the anode and the cathode of the apparatus, said separator comprising one or more layers of fibrous material.

The fibrous material may be wettable.

The wettable material may be a cellulose containing composition.

The cellulose containing composition may be paper.

The paper may be a filter paper.

The filter paper may be chemical resistant filter paper.

The filter paper may be medium to fast grade filter paper.

The invention extends to an electrolysis process carried out in an apparatus substantially as described above.

The process may include:

- establishing a potential difference between the anode and the cathode; and
- contacting the anode and cathode with an electrolyte from which gasses are liberated by electrolysis.

The process may include contacting the apparatus with an electrolyte solution of between 10% and 50% by mass of electrolytic salts, typically from 20% to 35% by mass.

The electrolyte solution may be a KOH, NaOH, or other alkaline solution.

The electrolyte solution may be acidic.

The process may be carried out at from 40°C to 100°C, typically from 60°C to 90°C.

The electrodes may be submerged in the electrolyte.

The electrolyte may be pumped through the separator of the apparatus.

The electrolyte may be drip fed through the separator, thereby maintaining the separator saturated with electrolyte while minimizing the volume of fluid being circulated.

Description of an Example of the Invention

The invention will now be described, by way of a non-limiting example only, with reference to the accompanying diagrammatic drawings and graph.

Example

A cross section of an electrode pair 10 is shown in Figure 1 (a).
The electrodes 12, 14 of the electrode pair 10 are made of a stainless steel mesh.

The nickel plated copper pipe 22 is used as support and electrical connector to the cathode. It serves also to extract the hydrogen gas.
The top part of the pipe is covered with insulating material 13 to prevent contact with the electrolyte.

A cylindrical plastic plug 18 serve as support and seal of the inner cathode.

The cathode, anode and separator are sealed 16 at the bottom and top ends to prevent any mixing of the gasses.

Electrical connection to the outer anode is achieved by connecting it with nickel plated copper strips to a nickel plated copper conductor immersed in the electrolyte.

The inner electrode 12 i.e. the H_2 cathode consists of two layers of fine mesh stainless steel. A copper pipe 22 forms the electrical contact. The total length is 130 mm with 100 mm exposed to the electrolyte. The inner electrode 12 is nickel plated to a thickness of about 200 µm on the mesh. Two layers of medium filter

paper 20 are wrapped around this mesh and the end points sealed with epoxy 16

The outer electrode 14, i.e. the O_2 anode consists of two layers of fine mesh stainless steel. The anode 14 is not plated with nickel. The bottom of the electrode 14 is sealed with a plastic stopper 18. An electrical contact is attached to the anode (not shown).

The electrode pair is immersed in the electrolyte. The electrolyte enters the inner pipe by liquid diffusion through the porous separator. The generated gasses are prevented from passing through the separator.

A plastic pipe 22 provides support.

The structure of a demister 40 is shown in Figure 1 (b).

The demister 40 consists of a 30 cm 22 mm diameter nickel plated copper pipe. The lower half 42 of the pipe contains rolled layers of course mesh stainless steel 44 around a plastic bar 46 with 10 mm diameter. The roll fits snugly in the pipe and traps all KOH spray and condenses most of the water vapour. The top half 48 is filled with brass curling to trap the remaining water vapour and cool the gasses down to room temperature. The heat is liberated to the atmosphere by normal convection and radiative cooling.

The above electrodes were tested using apparatus as described below.

A reactor which consists of a transparent plastic jar of 10 cm diameter and height 40 cm was used.

A KOH solution (25% m/m) was placed in the jar. The electrolyte was kept at a constant temperature for each experiment by supplying external heating. The electrode pair (as described above) was submerged in the electrolyte.

The generated gasses pass through demisters 40 on top of the reactor. These demisters 40 trap the KOH spray and water vapour at the high temperatures and deliver cooled dry gasses at room temperature.

A series of experiments were performed, measurement taken and current density (J-V) curves drawn as shown in Figure 2.

The purity of the gasses produced with a 79°C electrolyte was above 99.9%, without the need for further (separate) purification.

Claims

1. An electrolysis apparatus for the production of hydrogen and oxygen, which apparatus includes at least:-

two or more tubular electrodes, at least one of which is an inner electrode located in at least one outer electrode; and

a separator interposed between the inner and outer electrodes and substantially coextensive therewith.

2. An electrolysis apparatus as claimed in claim 1, wherein one or more of the electrodes is, in use, an anode.

3. An electrolysis apparatus as claimed in claim 1, wherein one or more of the electrodes is, in use, a cathode.

4. An electrolysis apparatus as claimed in any one of the preceding claims, wherein the separator is positioned between the anode and the cathode so that there is substantially no gap between the separator and the anode, and the separator and the cathode.

5. An electrolysis apparatus as claimed in any one of the preceding claims, wherein a portion of the separator is bonded to a support structure associated with the anode and/or the cathode.

6. An apparatus as claimed in any one of the preceding claims, wherein the electrodes are made of an apertured conductive material.

7. An apparatus as claimed in any one of the preceding claims, wherein the electrodes are plated with a conductive material.

8. An apparatus as claimed in any one of the preceding claimes, wherein the apertured conductive material is a sintered body having flow channels extending between the inside and the outside thereof.

9. An apparatus as claimed in claim 6 or claim 7, wherein the apertured conductive material is a single layer mesh.

10. An apparatus as claimed in claim 6 or claim 7, wherein the apertured conductive material includes two or more layers of mesh.

11. An apparatus as claimed in claim 6 or claim 7, wherein the apertured conductive material is a three dimensional mesh.

12. An apparatus as claimed in any one of claims 6 to 11, wherein the apertured conductive material includes a conductive polymer.

13. An apparatus as claimed in claim 12, wherein the conductive polymer is coated with a conductive material.

14. An apparatus as claimed in any one of claims 6 to 13, wherein the apertured conductive material comprises of one or more of silver, nickel, stainless steel, and copper.

15. An apparatus as claimed in any one of the preceding claims, wherein the anode and cathode are substantially concentric.

16. An apparatus as claimed in any one of the preceding claims, wherein a plurality of anodes and cathodes of various diameters are nested to provide a high electrolysis surface area to electrolysis apparatus volume ratio.

17. An apparatus as claimed in any one of claims 2, and 4 to 16, wherein the anode comprises one or more layers of stainless steel mesh.

18. An apparatus as claimed in any one of claims 2, and 4 to 17, wherein the anode is nickel plated.

19. An apparatus as claimed in any one of claims 3, and 4 to 16, wherein the cathode is made of one or more layers of stainless steel mesh.

20. An apparatus as claimed in any one of claims 2, 4 to 16, and claim 19, wherein the cathode is nickel plated.

21. An apparatus as claimed in claim 18 or claim 20, wherein the mesh is nickel plated before or after the layers of stainless steel are placed together.

22. An apparatus as claimed in any one of the preceding claims, wherein one or more of the tubular anode and the cathode are closed off at one end such that, in use, an overpressure is established within the closed off tubular electrode.

23. An apparatus as claimed in any one of the preceding claims, wherein one or more conductors are provided in association with the electrodes.

24. An apparatus as claimed in claim 23, wherein a tubular mesh conductor is provided on the outside of the outer electrode and another on the inside of the inner electrode.

25. An apparatus as claimed in claim 23, wherein the conductors are in the form of one or more conductive strips attached to a portion or portions of the electrodes.

26. An apparatus as claimed in any one of the preceding claims, wherein the separator comprises one or more layers of a fibrous material.

27. An apparatus as claimed in claim 26, wherein the separator comprises one or more layers of a wettable material.

28. An apparatus as claimed in claim 27, wherein the separator comprises one or more layers of a wettable fibrous material.

29. An apparatus as claimed in any one of the preceding claims, wherein the separator comprises one or more layers of cellulose containing composition.

30. An apparatus as claimed in claim 29, wherein the cellulose containing composition is paper.

31. An apparatus as claimed in claim 30, wherein the paper is a filter paper.

32. An apparatus as claimed in any one of the preceding claims, including :

- a tubular apertured stainless steel mesh anode electrode; and
- a tubular apertured nickel-plated stainless steel mesh cathode electrode,

wherein the cathode and anode are substantially concentric and the cathode lies within the anode

33. An apparatus as claimed in claim 32, including a separator means between the anode and cathode comprising one or more layers of a fibrous material.

34. An apparatus as claimed in claim 33, wherein the fibrous material is a wettable fibrous material.

35. An apparatus as claimed in any one of the preceding claims which, in use, includes an alkaline electrolyte solution.

36. An apparatus as claimed in any one of claims 1 to 34 which, in use, includes an acidic electrolyte solution..

37. An apparatus as claimed in any one of the preceding claims, including means for supplying and conducting electrical current to the electrodes.

38. An apparatus as claimed in any one of the preceding claims, including means for drawing off the gasses.

39. An apparatus as claimed in any one of the preceding claims, including means for removing vapour from the generated gasses.

40. An apparatus as claimed in any one of the preceding claims, wherein a plurality of electrode sets are used in parallel.

41. An apparatus as claimed in any one of the preceding claims, wherein a plurality of electrode sets are used in series.

42. An apparatus as claimed in any one of the preceding claims, wherein a plurality of electrode sets is arranged in a common electrolyte around a tubular conductor that is in contact with each electrode which acts as an anode.

43. An apparatus as claimed in claim 42, wherein each cathode is connected to its own conductor.

44. A separator for an electrolysis apparatus, which separator is interposed between the anode and the cathode of the apparatus, said separator comprising one or more layers of fibrous material.

45. A separator as claimed in claim 44, wherein the fibrous material is wettable.

46. A separator as claimed in claim 44 or claim 45, wherein the wettable material is a cellulose containing composition.

47. A separator as claimed in any one of claims 44 to 46, wherein the cellulose containing composition is paper.

49. A separator as claimed in claim 47, wherein the paper is a filter paper.

50. A separator as claimed in claim 48, wherein the filter paper is chemical resistant filter paper.

51. A separator as claimed in claim 48 or claim 49, wherein the filter paper is a medium to fast grade filter paper.

52. An electrolysis process carried out in an apparatus as claimed in any one of claims 4 to 43.

53. A process as claimed in claim 52, including:

- establishing a potential difference between the anode and the cathode; and
- contacting the anode and cathode with an electrolyte solution from which gasses are liberated by electrolysis.

54. A process as claimed in claim 52 or claim 53, including contacting the apparatus with an electrolyte solution of between 10% and 50% by mass of electrolytic salts.

55. A process as claimed in claim 52 or claim 53, including contacting the apparatus with an electrolyte solution of between 20% and 35% by mass of electrolytic salts.

56. A process as claimed in any one of claims 53 to 55, wherein the electrolyte solution is a KOH, NaOH, or other alkaline solution.

57. A process claimed in any one of claims 53 to 55, wherein the electrolyte solution is acidic.

58. A process as claimed in any one of claims 52 to 57, which process is carried out at a temperature of from 40°C to 100°C.

59. A process as claimed in any one of claims 52 to 57, which process is carried out at a temperature of from 60°C to 90°C.

60. A process as claimed in any one of claims 53 to 59, wherein the electrodes are submerged in the electrolyte.

61. A process as claimed in any one of claims 53 to 59, wherein the electrolyte is pumped through the separator of the apparatus.

62. A process as claimed in any one of claims 53 to 59, wherein the electrolyte is drip fed through the separator, thereby maintaining the separator saturated with electrolyte while minimizing the volume of fluid being circulated.

Abstract

The invention provides an electrolysis apparatus for the production of hydrogen and oxygen, which apparatus includes at least two or more tubular electrodes, at least one of which is an inner electrode located in at least one outer electrode, and a separator interposed between the inner and outer electrodes and substantially coextensive therewith. One or more of the electrodes may, in use, be an anode. One or more of the electrodes may, in use, be a cathode.
